Overview

Welcome to the course on TTrades Model

Within this course, you will learn TTrades approach to the markets. This includes both an exclusively OSOK model and fractal model which can be refined down for scalping. Since future courses will add onto this model, mastery of this course is a requirement before moving on to future lessons.

The goal for this model is to provide a defined and repeatable framework. An approach that any trader regardless of psychological profile or time constraints can apply.

Section 1: Concepts

The section on Concepts covers all the concepts and price signatures which are used throughout the course. This is where the foundational knowledge is set for the remainder of the course.

Section 2: Swing Highs & Lows

The section on Swing Highs & Lows is the foundation to the TTrades Model. It is a simplistic and repeatable approach to determining bias, knowing when to trade, and framing entries. It is important to understand this thoroughly before moving on to the following sections.

Section 3: Swing Confirmation

The section on the Swing Confirmation explains how to confirm the swing high or low based on the lower timeframe signature. Both timeframe pairing and projecting targets for expansion are covered within the lessons.

Section 4: Point of Interest

The section on Point of Interest covers where relevant swing highs and swing lows are formed. It is crucial to understand that not every swing high or low should be considered as a trade opportunity. Being able to determine the proper swing points is a core understanding within this model.

Section 5: TTrades OSOK Model

The section on the TTrades OSOK Model combines all the previous sections into a one-shot-one-kill system. It includes lessons on the economic calendar, Monday rule, daily swings, hourly confirmation, daily profile, price objectives, and entry logic.

Section 6: TTrades Fractal Model

The section on the TTrades Fractal Model takes all the previous lessons and combines them into a simple mechanical process of determining bias and finding entries. While this is TTrades personal scalping model, it can be applied on any timeframe.

Section 7: Examples

The section on Examples provides multiple reach chart setups from past price action. Examples within the course can be used as a reference for what to be seeking in a live market.

Concepts

Opposing Candles

Using Opposing Candles

During an intraday expansion, anticipate price to respect opposing close candles to the objectives.

Defining Opposing Candles

There are two principles to follow when marking out opposing close candles.

1. If there are a series of opposing close candles, use the opening price of the first candle in the series

Series of downclose candles: use the opening price of the highest downclose candle in the series

Series of upclose candles: use the opening price of the lowest upclose candle in the series

2. Ignore opposing close candles that are within a larger series of opposing close candles

Downclose candles within a larger series of downclose candles: focus on the larger series

Upclose candles within a larger series of upclose candles: focus on the larger series

Opposing Candles

Highs & Lows
Fair Value Gaps
Equilibrium
Projections

Where To Look For Opposing Candles

Opposing close candles should be supported by one of three points of interest; highs or lows, fair value gaps, and opposing close candles. Any opposing close candles which are not paired with a point interest should be ignored and avoided.

Read on to learn about the three points of interest:

Highs and Lows

Once either a high or low is swept, a closure through a series of opposing candles is the confirmation.

Opposing Candles

Highs & Lows
Fair Value Gaps
Equilibrium
Projections

Opposing close candles on the failure swing are used when an SMT is present.

Opposing Candles

Highs & Lows
Fair Value Gaps
Equilibrium
Projections

Fair Value Gaps

Once a fair gap is traded into, a closure through a series of opposing candles is the confirmation.

Opposing Candles

Fair Value Gaps
Equilibrium
Projections

Highs & Lows

Framing Reversals

Reversals are framed at highs and lows and confirmed by the close through the opposing close candles which ran into the level.

Below are the two steps to this process:

Swing high or low formation

Equilibrium

Using Discount and Premium

There are two ways discount and premium, or equilibrium is used in the model.

Ranges

By using equilibrium of ranges, targets can be framed when trading back into the range. Equilibrium is also used to identify points of interest for trading out of the range.

When trading into the range, equilibrium is an objective.

When trading out of a range, equilibrium is a point of interest.

Opposing Candles
Highs & Lows
Fair Value Gaps
Equilibrium
Projections

Previous Candle Equilibrium

The main way equilibrium is applied within this model is by using equilibrium of the previous candle range or the previous candle wick. This will be discussed in further detail within upcoming lessons.

For reversals with large wicks, equilibrium of the previous candle wick is used as framework. The following candle should remain in respect to this level for a valid reversal.

For a continuation, equilibrium of the previous candle range is used as framework. The following candle should remain in respect to this level for a valid continuation.

- Opposing Candles
- Highs & Lows
- Fair Value Gaps
- Equilibrium**
- Projections

Projections

Determining Targets

As discussed in the previous lesson, equilibrium and liquidity can be used both as trade objectives and points of interest for a potential reversal. For the TTrades Model, the main focus for identifying targets is using standard deviation projections.

There are two ways to project the reversal:

Manipulation Projection

Anchoring the projection will be done this way in the majority of scenarios:

Bullish: low to the pervious high which made the highest high

Bearish: high to the previous low which made the lowest low

Opposing Candles
Highs & Lows
Fair Value Gaps
Equilibrium
| Projections

Failure Swing Projection

The projection changes in certain scenarios when the manipulation leg is large. What is a large manipulation leg? When the projection is far overextended from any price logical objective for candle 3 or 4 to reach.

Bullish: lowest low to the high which formed the failure swing

Bearish: highest high to the low which formed the failure swing

Below is the settings for the fibonacci retracement tool:

Opposing Candles
Highs & Lows
Fair Value Gaps
Equilibrium
Projections

Swing Highs & Lows

Swing High & Low

Understanding Swing Highs & Lows

The market must form a swing high or low in order for price to reverse; there is no other way. Using that understanding is the foundation of the TTrades Model.

There are 3 candles that form a swing high or low. The focus will be on those 3 candles with the 3rd and 4th candles having potential opportunity following the swing high or low.

Numbering Candles

Candle 1 will always be the candle before the high or low

Candle 2 will always be the candle that forms the high or low

Candle 3 will always be the candle following the high or low

Candle 4 will always be the candle following candle 3

Below is an example of numbering the candles:

Swing High & Low

Candle 2 Closure

Candle 3 Closure

Wicks & Equilibrium

Ideal Formation

The next two sections will discuss the two types of candle closures used to anticipate a swing formation.

Candle 2 Closure

Reversal Candle Closure

This is the first of the two swing formations focused on within the model.

Candle 2

Bullish: takes the low of candle 1 and closes back above candle 1 low

Bearish: takes the high of candle 1 and closes back below candle 1 high

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

With a valid candle 2 closure, there is an anticipation for candle 3 to expand.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

With a strong bearish or bullish closure on candle 3, candle 4 is likely to be a continuation.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Candle 3 Closure

Conditional Rule

This is the second of the two swing formations focused on within the model.

Candle 3

Due to candle 2 failing to close inside the range of candle 1, more data is needed to determine if this is likely a swing formation. Allow candle 3 to form without participating, this is the best option in this scenario.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

If candle 3 forms a strong bearish or bullish candle close, this validates the formation of the swing. Due to this closure on candle 3, candle 4 becomes a likely continuation away from the previously established swing point.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Below is what a candle 4 continuation looks like within this conditional scenario.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Wicks & Equilibrium

Understanding Order Flow

Candle wicks and the equilibrium of candle ranges are crucial to the understanding of order flow. In this lesson, the use of equilibrium within the model is covered.

Candle 2 Closure: Wick

With a candle 2 closure inside the range of candle 1, the wick is used to frame the candle 3 continuation.

Bullish: the upper half of the wick to support price higher

Bearish: the lower half of the wick to support price lower

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Candle 3 remains in respect to equilibrium of the candle 2 wick.

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

With a strong closure of candle 3 in respect to the wick of candle 2, candle 4 is a probable continuation. The framework is used by taking equilibrium of the candle 3 range.

Bullish: the upper half of candle 3 to support candle 4 higher

Bearish: the lower half of candle 3 to support candle 4 lower

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Candle 2 Closure: No Wick

With a candle 2 closure lack a large wick for framework, equilibrium should be taken using the candle range.

Bullish: the upper half of candle 2 to support price higher

Bearish: the lower half of candle 2 to support price lower

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Candle 3 Closure: Condition

With candle 2 failing to close back within the range of candle 1, candle 3 should be avoided.

Bullish: the upper half of candle 3 to support price higher

Bearish: the lower half of candle 3 to support price lower

Swing High & Low
Candle 2 Closure
Candle 3 Closure
Wicks & Equilibrium
Ideal Formation

Candle 4 expansion occurs in respect to equilibrium of the candle 3 range.

Ideal Formation

Swing Confirmation

CISD Confirmation & Projection

Swing Confirmation and Targets

With an established understanding of swing points and the foundation of the model, confirmations and targets are the following step. Lower timeframes are used for both change in state of delivery confirmation and anchoring projection targets.

The swing formation is confirmed by a lower timeframe change in state of delivery (CISD) within candle 2. While the CISD is most often validated within candle 2, it can also be validated by candle 3.

Timeframe Pairing

Weekly Swing Point → 4 Hour CISD

Daily Swing Point → 1 Hour CISD

4 Hour Swing Point → 15 Minute CISD

1 Hour Swing Point → 5 Minute CISD

30 Minute Swing Point → 3 Minute CISD

15 Minute Swing Point → 1 Minute CISD

Candle 2 Closure CISD

Following a candle 2 closure, move to the lower timeframe to confirm the CISD within candle 2.

Candle 3 Closure CISD

Following a candle 3 closure, move to the lower timeframe to confirm the CISD within candle 2 which can often be validated on candle 3.

Step-by-Step

Following the candle 2 closure, the lower timeframes should be examined for a CISD confirmation.

| CISD Confirmation & Projection

Identify and annotate the CISD which acts as a reversal confirmation.

| CISD Confirmation & Projection

Projecting out the manipulation leg of the reversal for targets on candle 3 expansion and candle 4 continuation.

| CISD Confirmation & Projection

The first projection target at -2 is reached with candle 3 expansion.

POI

Opposing Candles

Opposing Candles for Point of Interest

Opposing close candles will be used as a point of interest for where swing formations are established.

Opposing candles formed and validated on a close through.

Opposing Candles

Highs & Lows
Fair Value Gaps

TTrades_edu

Price trades into the opposing candles and has a candle 2 closure within candle 1 range.

Candle 2 closure at the opposing candle gives anticipation of candle 3 expansion.

Highs & Lows

Highs & Lows for Point of Interest

Highs and lows will be used as a point of interest for where swing formations are established.

High or low is swept and candle 2 closes back into the range.

Opposing Candles
Highs & Lows
Fair Value Gaps

Candle 3 is an expansion away from the previously swept high or low in respect to candle 2.

Opposing Candles
Highs & Lows
Fair Value Gaps

TTrades_edu

Fair Value Gaps

Fair Value Gaps for Point of Interest

Fair value gaps will be used as a point of interest for where swing formations are established.

While the fair value gap is being retested, entries are not taken within candle 1 as the swing formation is yet to be confirmed in candle 2 or candle 3.

Opposing Candles
Highs & Lows
Fair Value Gaps

Candle 2 closure confirms the swing point within the fair value gap.

Opposing Candles
Highs & Lows
Fair Value Gaps

Candle 3 is an expansion away from the fair value gap in respect to candle 2.

Economic Calendar

Applying the Economic Calendar

Link to the economic calendar: <https://www.forexfactory.com/calendar>

Settings

The goal of adjusting the format of the economic calendar is to remove all the noise which is present on the standard settings. Most of the events which occur throughout the week either do not hold enough significance to take it into account or they do not have any impact on the market you are trading. All you want on your economic calendar is red folder news events which are relevant to the market you trade.

Step 1: Remove gray, yellow, and orange folder news events

Step 2: Choose the currencies which correlate to the market you trade

Step 3: Set the calendar to the current week view

After you complete these simple steps, you should have an economic calendar which only displays red folder news events within the current week for the market you trade.

How to select the right currency?

Indices: USD (direct correlation)

Forex Major Pairs: USD (main focus) and the cross currency

Crypto: USD (secondary correlation)

Below is what your economic calendar should look like after all adjustments are made

How does the economic calendar impact market conditions?

The economic calendar is the foundation to anticipating market conditions.

Studying the layout of news events within a single week sets the initial expectation for how favorable the price action will be upon entering the market. If the market is in anticipation for a news event, the previous price action is likely to be manipulative in the form of consolidations or opposing runs. If the market has

released news events, the following price action is more likely to expand in the intended direction.

High Impact News

When high impact news events are present within the weekly layout of the economic calendar, it will have an impact on the weekly range. This will determine the days which are chosen to seek potential trade opportunities.

Medium Impact News

When medium impact news events are present within the daily layout of the economic calendar, it will have an impact on the daily range. This will determine the sessions which are chosen to seek potential trade entries.

By focusing on the weekly and daily range in relation to these news events, we can be confident that trades will be opened only during favorable market conditions. Expansion is a requirement to make money from the markets; without a directional move, there is no profit to be made.

What are the rules around the economic calendar?

Rules around specific events within the economic calendar layout are applied in order to ensure participation in favorable market conditions and to be in respect to sustainable risk management.

The Rules

1. Avoid opening trades the day prior to a high impact news event.

This is done as a precaution to avoid the days which are more likely to be ranged than expanded. When the market is waiting in anticipation for a high impact news event, price has the tendency to either consolidate or make false price runs. The closer the time gets to the release of the high impact news event, the more unfavorable the price action becomes; filtering out the day prior is enough to stay clear of that negative effect.

2. Avoid opening trades any session prior to a medium impact news event.

In the same way that high impact news negatively effects the day prior, medium impact news negatively effects the sessions prior. Within the scenario there is a medium impact news event (or high impact news event) on a day you are seeking a potential trade opportunity, only seek entries following the release. You will understand how this can be used as an edge for entries in a later lesson.

3. Never hold an open position through either a high or medium impact news event.

Once released into the market, both high and medium impact news events cause significant fluctuations in volatility as the market is highly correlated to the outcome of the results. This is a brief time in the market where spreads widen and price becomes highly manipulative; you lose complete control of risk management during these moments. No matter how confident you feel on the direction, the reward of being correct does not outweigh the unlimited potential loss of being incorrect.

What are high impact news events?

Consumer Price Index M/M (CPI)

Non-Farm Payroll (NFP)

FOMC Press Conference

What are medium impact news events?

Core PCE Price Index M/M

Producer Price Index M/M (PPI)

FOMC Statement

These are small sacrifices to make in order to guarantee you are giving yourself the best chance to protect your mental and monetary capital in times of unfavorable market conditions. You will make yourself in trading by how you can limit unnecessary losses, all while exploiting the winning trades; this is the first step towards that.

What is the rule for Monday?

Monday is a day of the week that trading will be avoided in all scenarios. Why? Learn the three reasons below.

Reason One

Based on data collected across the past three years, Monday is the smallest ranged day on average in both the range from the daily candle high to low and from the daily candle open to close. This means that Monday is the least likely day of the week to offer a large range, directional daily candle. We are filtering out the lowest probability conditions by simply avoiding this one day each week as the Foundation Model is aimed at capturing expansions.

Economic Calendar

Daily Swing
Weekly Profile
Hourly Confirmation
Daily Profile
Entries

Reason Two

There is never medium or high impact news events on Monday. All of the relevant news drivers throughout each week occur across Tuesday, Wednesday, Thursday, and Friday. This means that on Monday, the market is always waiting in anticipation for something more significant to be released on a following day within the week. Not only does this play into the reasoning for why the data shows Monday having

the smallest average range, but also provides logic to this rule. The way in which news events enter the market adds narrative to price; you will learn this in an upcoming lesson.

	08:30	>>	USD	📅	Producer Price Index M/M
Fri	08:30	>>	USD	📅	Non-Farm Employment Change

Reason Three

Utilizing weekly range profiles is a major part into the effectiveness of this model as it removes certain levels of discretion in the charts. This is done by looking back at

how the previous days printed in order to build an expectation for where and how the following days within the week will print. However, on Monday there is no day within the week to look back on. You would be trading a weekly profile that is nonexistent which would invite that unwanted discretion back into your analysis. To apply the process of weekly profiles, avoiding Monday is an indisputable rule to simplify the approach.

Daily Swing

Daily Chart Analysis

The majority of the analysis is done on the daily chart. If the following daily candle cannot be anticipated with a clear one-sided expectation, then there is no reason to be seeking entries within that day.

Look for a candle 2 or candle 3 closure on the daily chart at a point of interest. If a swing formation can be used to anticipate the next daily candle direction, then the analysis will continue.

Economic Calendar

Daily Swing

Weekly Profile

Hourly Confirmation

Daily Profile

Entries

Weekly Profile

Blending Weekly Profiles with Daily Swing Points

Weekly profiles offer the element of time to the weekly range and partially reduces discretion by applying a series of "if this, then that" statements.

Weekly Profiles

Using the previous lessons on swing points which set an initial expectation for price, weekly profiles add to the narrative by introducing an element of time. We can look back on how the previous days printed on the chart to tell how the following days should deliver. Understanding this, anticipating price swings becomes more obvious as the weekly range develops; Tuesday is more obvious than Monday, Wednesday is more obvious than Tuesday, Thursday is more obvious than Wednesday, and Friday is more obvious than Thursday.

Instead of making unnecessary predictions on price, take advantage of the weekly profiles to establish systematic criteria. If the previous days did this, then the following days should do this. What if you are unclear on the weekly profile at any point? Then you wait for another daily candle to print for additional narrative. Take it one day at a time until the weekly profile is either validated or invalidated.

Classic Expansion

Midweek Reversal

Consolidation Reversal

Thursday Counter

Applying Swing Points

Using what was learned in the previous sections, the lessons will be paired with the weekly profile.

As displayed in the image below, each weekly profile has a daily swing point which forms the high or low of week. The best trade opportunities exist within the candle 3 and candle 4 following the confirmation of the swing point on candle 2 close.

Determining the Weekly Profile

Once it is understood what the expectation is for price based on the daily and hourly price delivery, we will pair weekly profiles to bring everything together on

the higher timeframes. Following the hourly change in state of delivery at the relevant point of reversal on candle 2, look back on how the previous days traded. This will either invalidate or add to your anticipation for the following expansion.

Classic Expansion

Anticipating a reversal on a Tuesday? Look back at how Monday traded.

If Monday was consolidated or made a shallow opposing run from the weekly opening price, then the narrative is supported for Tuesday (candle 2) to reverse into an expansion.

You then trade with the expectation of the complete Classic Expansion weekly profile until it is otherwise invalidated. What is the expectation? Wednesday (candle 3) and Thursday (candle 4) expansion away from the Tuesday reversal.

If Monday had a large range expansion to either direction, then the narrative is not supported for Tuesday to reverse into an expansion

You then wait for the narrative to reestablish and a new opportunity to present itself

This same logic applies to a classic expansion weekly profile which forms the reversal on a Monday. The only difference is that candle 1 is the Friday from the previous week.

Economic Calendar
Daily Swing
Weekly Profile
Hourly Confirmation
Daily Profile
Entries

Classic Expansion (Counter-Trend)

Anticipating a reversal on a Friday? Look back at how Monday, Tuesday, Wednesday, and Thursday traded.

If Monday or Tuesday formed an opposing reversal and expanded through Thursday, then the narrative is supported for Friday to reverse into an expansion

You then focus on trading back into 20.0% to 50.0% back into the weekly range as an objective.

If Monday or Tuesday did not form an opposing reversal or there was no expansion through Thursday, then the narrative is not supported for Friday to reverse into an expansion

You then end your trading week and wait for a new opportunity to present itself the following week

This is the only scenario within this model to seek trades on candle 2 within the anticipated swing point.

Economic Calendar
Daily Swing
Weekly Profile
Hourly Confirmation
Daily Profile
Entries

Midweek Reversal

Anticipating a reversal on a Wednesday? Look back at how Monday and Tuesday traded.

If Monday and Tuesday consolidated or make any amount of an opposing run from the weekly opening price, then the narrative is supported for Wednesday (candle 2) to reverse into an expansion

You then trade with the expectation of the complete Midweek Reversal weekly profile until it is otherwise invalidated. What is the expectation? Thursday (candle 3) and Friday (candle 4) expansion away from the Wednesday reversal.

If Monday and Tuesday expanded off another point of reversal, then the narrative is not supported for Wednesday to reverse into an expansion

You then wait for the narrative to reestablish and a new opportunity to present itself

Consolidation Reversal

Anticipating a reversal on a Thursday? Look back at how Monday, Tuesday, and Wednesday traded.

If Monday, Tuesday, and Wednesday were consolidated, then the narrative is supported for a Thursday reversal into an expansion

You then trade with the expectation of the complete Consolidation Reversal weekly profile until it is otherwise invalidated. What is the expectation? Friday (candle 3) expansion away from the Thursday reversal (candle 2).

If Monday, Tuesday, and Wednesday failed to consolidate, then the narrative is not supported for a Thursday reversal into an expansion

You then wait for the narrative to reestablish and a new opportunity to present itself

Economic Calendar
Daily Swing
Weekly Profile
Hourly Confirmation
Daily Profile
Entries

Thursday Counter

Anticipating a reversal on a Thursday? Look back at how Monday, Tuesday, and Wednesday traded.

If Monday, Tuesday, and Wednesday each expanded in the same direction, then the narrative is supported for a Thursday reversal into an expansion

You then trade with the expectation of the complete Thursday Counter weekly profile. What is the expectation? Friday (candle 3) expansion away from the Thursday (candle 2) reversal.

If Monday, Tuesday, or Wednesday failed to expand in the same direction, then the narrative is not supported for a Thursday reversal into an expansion

You then wait for the narrative to reestablish and a new opportunity to present itself

Hourly Confirmation

Confirming the Swing

After aligning the daily swing and the weekly profile, the hourly chart is used to identify a 1-hour change in state of delivery which confirms the candle 2 reversal.

Once the CISD is established and confirmed, anchor the manipulation leg to project out the expansion targets for the following days of the week.

Bullish example:

Daily Profile

How to use daily profiles to confirm an established bias?

Daily profiles are another profiling tool which can be used to reduce discretion and give added confirmation to your determined bias.

The Profiles

For the TTrades Model, everything is refined down to only two daily profiles.

1. London Reversal
2. New York Reversal

Just as every week has a point of reversal, every day has a point of reversal. The intraday reversal which is framed through daily profiles is the foundation for how entries are positioned.

London Reversal

If London reverses, then seek New York continuations

Entry Logic

OSOK Entries

Entries are considered only after the following steps are completed:

Identified a swing forming on the daily chart

Aligned with one of the four weekly profiles

Confirmed and projected targets on the hourly chart

Aligned the directional bias with a daily profile

The daily profile will be aligned after an intraday CISD is established. Following this signature, opposing candles and swing formations will be used for entries on the 15-minute, 5-minute, and sub 5-minute timeframes.

CISD and Opposing Candle Entries

Entering following the confirmation of a relevant opposing candle; either market on the opening of the first candle following the validation or a limit on the opposing candles.

Minimum Risk to Reward

2R is the minimum requirement before taking profit on an open position. Profit will be taken at projections, liquidity levels, opposing candles, and opposing swing formations.

TTrades Fractal Model

Fractal Model

A Model For Any Timeframe

The TTrades Fractal Model is made up of three components:

1. Higher timeframe swing formations
2. Lower timeframe CISD confirmation and projection
3. Positioning entries within expansion candles

Candle 2 closure: finding lower timeframe entries within candle 3 and candle 4

Candle 3 closure: finding lower timeframe entries within candle 4

Below are the timeframe pairings to be used:

Swing Point → CISD in Candle 2

Weekly Swing Point → 4 Hour CISD

Daily Swing Point → 1 Hour CISD

4 Hour Swing Point → 15 Minute CISD

1 Hour Swing Point → 5 Minute CISD

30 Minute Swing Point → 3 Minute CISD

15 Minute Swing Point → 1 Minute CISD

Example

On the higher timeframe, there is a valid candle 2 closure. The next step is to identify a lower timeframe CISD to confirm the anticipated swing formation.

| Fractal Model

Annotate the CISD and anchor the projection for targets on the lower timeframe.

In addition to this, mark out equilibrium of the candle 2 wick on the higher timeframe. Price should remain in respect to equilibrium of the candle 2 wick in order to begin trading towards objectives.

Fractal Model

Candle 3 expanded away from the candle 2 swing point while remaining in respect to equilibrium of the higher timeframe wick. Several entries off opposing close candles and swing formations are offered within candle 3.

With a valid closure, annotate the equilibrium of the candle 3 range. Identify a lower timeframe point of interest which remains in respect to equilibrium of the candle 3 range as that provides framework for a candle 4 continuation.

| Fractal Model

Candle 4 is a continuation in respect to equilibrium of the candle 3 range and trades to the -4 projection.

Examples

TTrades OSOK Model

Example of TTrades OSOK Model

This example shows a daily swing formation, hourly confirmation, projected targets, and alignment with a daily profile.

Daily Chart

Following the valid candle 2 closure, equilibrium of the wick is annotated in order to frame candle 3. It is expected that candle 3 is an expansion to the downside while remaining in respect to the lower half of the candle 2 wick.

Hourly Chart

With the closure of candle 2 on the daily chart, the hourly timeframe is used to confirm the swing formation with a change in state of delivery. Projections are then anchored to the manipulation leg once the CISD is identified which will provide targets for the expansion and continuation of the following candles.

The CISD is identified and annotated on this hourly chart as the opening price of the lowest upclose candle in the series of upclose candles which reversed price. Once price closes below this level to confirm the reversal, the projection is anchored to the manipulation leg for trade objectives.

On the following day which is candle 3, New York session trades back into the opposing close candles on the hourly chart. This is an area that is expected to resist price in order to begin trading to the downside.

15-Minute Chart

Refining the view down to the 15-minute chart, a few questions are asked with the anticipation of candle 3 to be an expansion to the downside.

Did London form a high and reverse? No, so the daily profile is not a London Reversal.

Did London make an opposing run back into the range within a point of interest? Yes, so the daily profile is a New York Reversal.

What are the targets for a bearish New York Reversal daily profile?

London Lows

Asia Lows

Projections

With the targets marked out on the chart, wait for an intraday CISD to be established before attempting to get onside with the expansion.

During the New York session, the market displaces lower. Is there a confirmed change in state of delivery on the entry timeframe? If yes, then where are the projections anchored?

The CISD is confirmed with this displacement lower as there is a close below the opening price of the lowest upclose candle within the series of upclose candles. This is expected to be the high of candle 3 and the expansion can begin to the downside.

Projections are then anchored on the manipulation leg in the same way it is done on the higher timeframe.

The opposing close candles create swing highs for price to push lower into the overnight lows and projected targets.

Several entries are offered within the candle 3 expansion to the downside.

Daily Chart

Following the candle 3 closure, move back out the daily chart to begin framing the expectation for candle 4. Candle 3 had a strong bearish close which validated the upclose candle as a point of interest; this is the ideal swing formation.

Annotate both the opening price of the upclose candle and equilibrium of the candle 3 range. It is expected that candle 4 will offer a continuation to the downside while remaining in respect to the opposing candle and equilibrium of candle 3 range.

Hourly Chart

With the daily chart framed, the timeframe is now moved back down to the hourly. The order flow is bearish since the CISD has already formed and the market has expanded away from that point. Identify a point of interest within the lower half of the candle 3 range and around the opening price of the daily upclose candle.

Oposing close candles are annotated as a point of interest in the lower half of the candle 3 range.

Price trades up into the point of interest on the hourly chart. This is where resistance is expected begin the continuation to the downside.

15-Minute Chart

Refining the view down to the 15-minute chart, a few questions are asked with the anticipation of candle 4 to be a continuation to the downside.

Did London form a high and reverse? No, so the daily profile is not a London Reversal.

Did London make an opposing run back into the range within a point of interest? Yes, so the daily profile is a New York Reversal.

With the targets marked out on the chart, wait for an intraday CISD to be established before attempting to get onside with the continuation.

As there is yet to be a confirmed CISD, no entry is to be taken.

With the higher high being made, the CISD moves to the newly established upclose candles.

Following the formation of a new high and a valid candle 2 closure, there is a lower series of candles that made the new high. Mark out this opposing candle on the 15-minute chart.

This upclose candle provides the confirmation of a CUSD with the close below.

Anchor the projections from the low of the move up that made the new higher high. While it is not perfectly clear on the 15-minute chart below, it will make more sense when the manipulation move is observed on a relative lower timeframe.

The candle 2 closure below validates the opposing candles and the entry is on the open of candle 3 with a stop loss at the high of candle 2.

The first target is achieved that the overnight low which is a beyond the 2R minimum requirement.

The second target is achieved at the -4 projection from the intraday manipulation leg.

The third target remains open for a candle 5 continuation lower while remaining in respect to equilibrium of the candle 4 range.

All targets are traded through.

While possible, it is not necessary to trade the candle 2 reversal at the highs. The continuations which follow on candle 3 and candle 4 often give both a larger expansion and a more simple framework to trade.

Final look at the daily swing formation.

TTrades Fractal Model

Example of TTrades Fractal Model

This example shows the steps of a 1-hour fractal setup.

Hourly Logic

The valid candle 2 closure within the range of candle 1 gives the anticipation for the following hourly candle 3 to be an expansion to the downside.

5-Minute Chart

Moving down to the 5-minute chart from the hourly, identify a change in state of delivery within candle 2 in order to confirm the swing formation. Once identified and confirmed with a close through, anchor the manipulation leg to project targets for the candle 3 expansion and candle 4 continuation lower.

Also, annotate equilibrium of the hourly candle 2 wick as the lower half should be respected and used as framework for the following candles.

Price respects the opposing close candles at the equilibrium of the candle 2 wick. This signature forms a valid candle 2 closure on the 5-minute chart which offers an additional sell entry.

Price validates a new upclose candle as it moves lower off the previous candle 2 closure.

Both the retest of the upclose candle and the valid candle 3 closure offer an entry to get onside with the move lower.

Price continues to remain in respect to the lower timeframe opposing close candles.

As the hourly candle 3 closed strong to the downside, mark out equilibrium of the candle 3 range as candle 4 should trade lower in respect to the lower half of the range. The hourly range can be refined by identifying opposing candles on the 5-minute within the lower half of the candle 3 range; these act as the point of interest.

The opposing close candles within the lower half of the hourly candle 3 range provide framework for the candle 4 continuation lower. Maximum expansion is achieved once the -4 projection is traded into.
