Swing Formation

too°

Swing formation #1

Swing formation #2

Every reversal in the market forms a swing high or low.

Understanding where reversals in the market can form is a crucial step to **trade swings efficiently**.

As manipulation is found around key levels. We want a swing formation there.

A swing is formed in **3 candles** and 2 variations.

With this model, **only the candles after the reversal candle are traded**.

Timeframe Alignment

too°

HTF Swing

Monthly	Weekly	Daily	4h	1h	30m	15m
Daily	4h	1h	15m	5m	3m	1m

LTF Structure

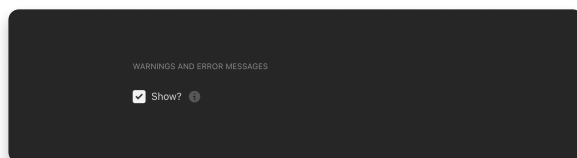

The indicator automatically switches and shows the model according to the selected timeframe but can also be used with a custom timeframe pairing.

Example: On a 3m chart a 30m > 3m model will be displayed. However, this can be adjusted in the settings to show a 1h > 3m model.

Settings

too°

Warnings and Error Messages

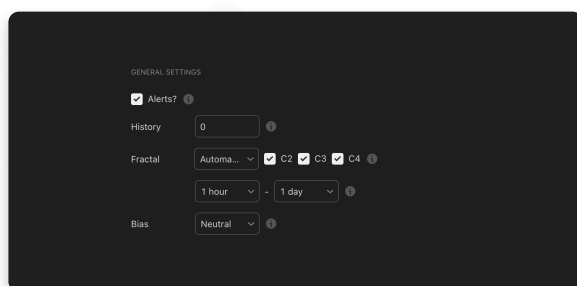

This indicator supports Timeframe pairings (e.g., 5m-1H, 15m-4H).

If you select a timeframe larger than the lower Timeframe (LTF) view (e.g., viewing a 15m chart when 5m-1H is enabled), the indicator will display an error message within the table.

Although the higher Timeframe (HTF) candle plotting will remain visible, note that the LTF's CISD and associated projections will not render in this view.

General Settings

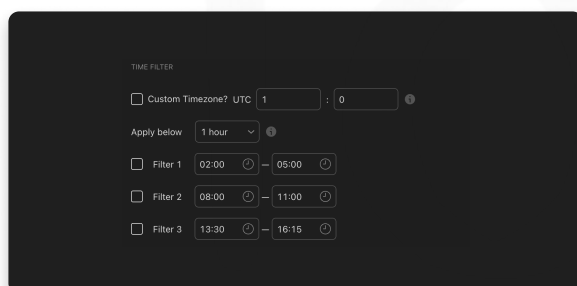

Historical Setups: Control the number of past setups visible on your chart, from "current setup only" up to 40 historical setups, allowing for additional context.

Fractal Pairing: Choose timeframe pairings (e.g., 1H-1D) or mix any timeframes together to align lower timeframe analysis within the structure of a higher timeframe.

Bias Selection: Set a market bias to focus on bullish, bearish, or neutral setups, allowing you to filter for directional trades or monitor both sides of the market.

Time Filters

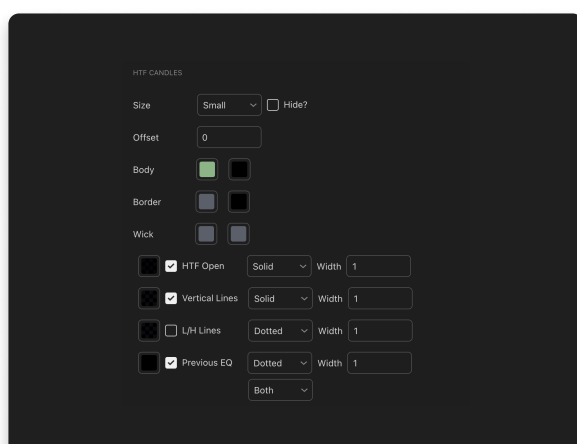

Custom timezone: Specify a timezone used for the time filters.

Apply Below: Specify a timeframe threshold below which time filters will be applied, helping you narrow down relevant sessions.

Custom Session Filter: Define up to three custom time filters (e.g., 02:00 - 05:00, 08:00 - 11:00), targeting specific trading sessions or hours for focused analysis.

HTF Candles

Candle Size: Adjust the size of higher timeframe candles.

Offset: Shift higher timeframe candles on the chart. Use a positive value to move right, negative to move left.

Visibility Toggle: Option to hide or display higher timeframe candles.

Body, Border, and Wick Colors: Customize colors for each candle component to distinguish HTF structures clearly within your chart setup.

Marker Options: Enable open/close markers and high/low lines for HTF candles, with customizable line styles and widths for added clarity.

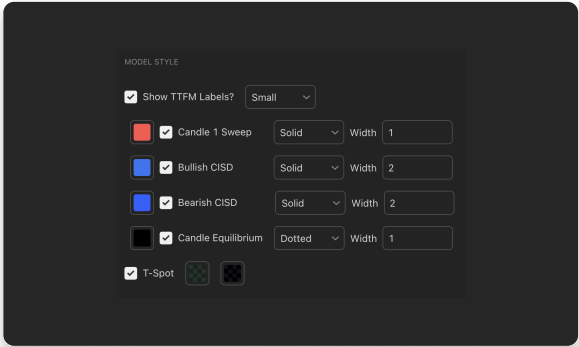

Previous EQ: Display the Equilibrium of the previous candle on both the LTF and HTF.

Settings - Continued

Model Style

Show TTrades Fractal Model Labels: Choose whether to display model labels (C2, C3, C4) and adjust the label size to keep key points visible.

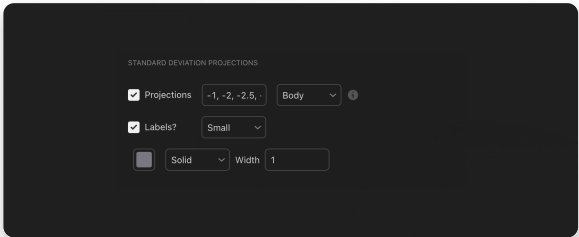

Candle 1 Sweep: Style the Candle 1 Sweep marker, adjusting line type and width to highlight this initial liquidity marker.

Change in State of Delivery (CISD): Customize CISD lines to mark significant shifts in delivery, signaling potential trend changes.

Candle Equilibrium: Display equilibrium points at 50% of HTF ranges to assist in identifying discount and premium areas.

T-Spot Indicator: Enable and style the T-Spot marker to highlight anticipated wick points on HTF candles, aiding in identifying high-probability price areas.

Projections

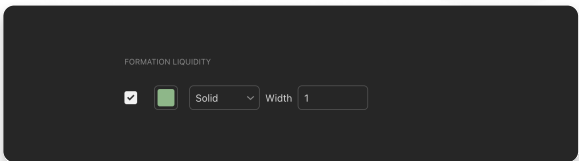

Projection Levels: Enable future price projection levels based on previous orderblock behavior, which will help you identify potential price responses. Choose to align the STDV projections on the wick or the body of the candles.

Label Visibility: Choose to display labels for each projection level, providing clarity on each identified orderblock.

Label Styling: Customize label size, style, and color to ensure projected levels are distinguishable on the chart.

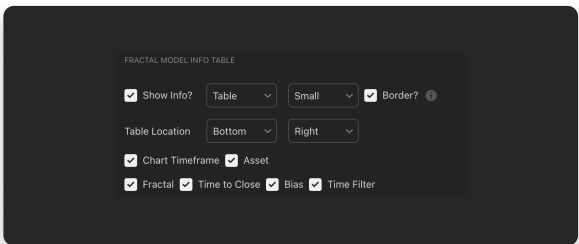

Formation Liquidity

Liquidity Markers: Highlight critical liquidity zones from previous highs and lows, marking engineered liquidity pools that can influence price.

Line Style and Width: Customize the appearance of liquidity markers, choosing between dotted or solid lines, and adjust line thickness for visibility.

Fractal Model Info Table

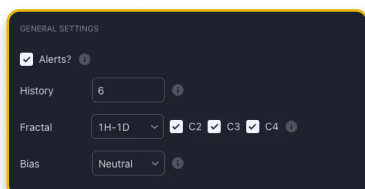

Information Type and Table Customization: Choose to view the Fractal Model information in Table form, or On Chart below the HTF Candles. Customize the table's position, size, and whether to have the borders of table cells for convenient visualization to the data.

Information Details: Choose specific details to display in the info, such as Fractal pairing, Time to Close, Bias, and applied Time Filters, ensuring that relevant insights are available at a glance.

Alert Settings

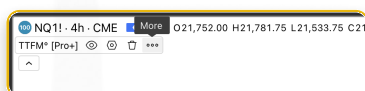

too°

1

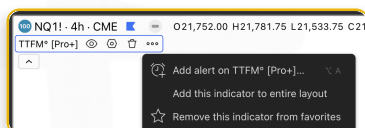

Make sure your Alerts tab is toggled with a check mark

2

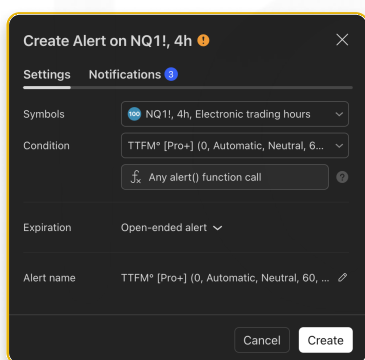

Head over to the Indicator Name and Click the 3 dots that reads "More"

3

After clicking the 3 dots, a menu will pop up where hover over and select "Add alert"

4

After selecting "Add alert", a new popup will then appear where you will see your TTrades Fractal Model settings confirmed with related inputs.

Make sure to be on the timeframe of the model at the time of setting this up.

Example: to receive alerts of a 1h > 5m model you will need to be on the 5m.

Example: #1

too°

HTF: Daily

On the higher timeframe we are looking for a swing formation inside a point of interest to frame a possible reversal in the market.

We see a potential swing by how the last candle swept the previous and closed inside after reaching an old high (POI).

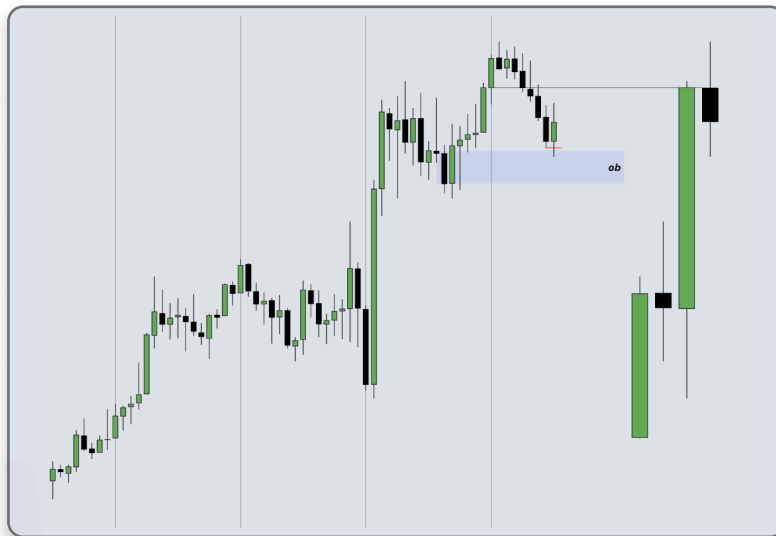

LTF: 1h

Once the swing is confirmed in Candle 2, we can look to engage within Candle 3. A short position can be taken at a valid 1-hour swing point, utilizing the model in a fractal manner or applying any preferred entry technique. In this particular example, an entry was taken following the formation of an order block (OB).

Example: #2

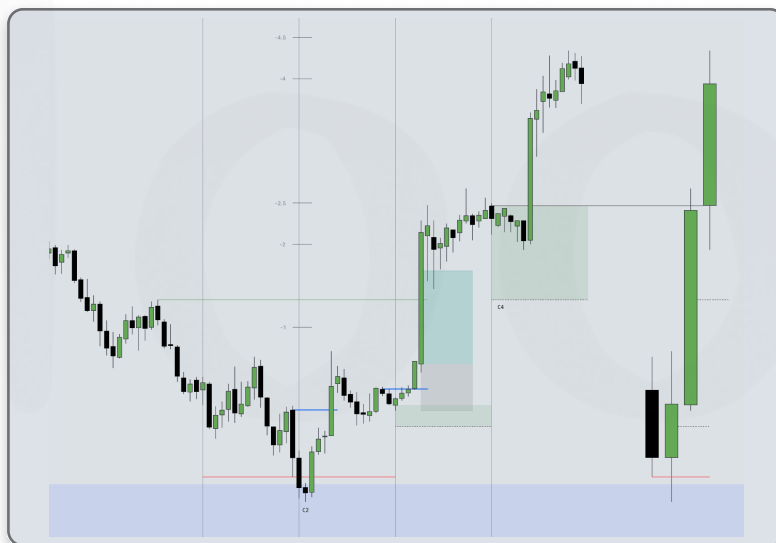

too°

HTF: 15m

Just as in the previous example, on the higher timeframe, we are looking for a swing formation inside a point of interest to frame a possible reversal in the market.

We see a bullish swing formation after reaching an orderblock (POI).

LTF: 1m

Once the swing is confirmed in Candle 2, we can look to enter within Candle 3. A long position can be taken at a key swing point, applying the model in a fractal manner or utilizing any preferred entry technique. In this specific example, an entry was executed after the formation of an orderblock (OB).

Conclusion

Summary

Every reversal forms a swing point.

Manipulation is found inside the wick of a reversal candle.

Reading the price dynamics between HTF and LTF Candles can help us understand a reversal development.

Utilizing the TTrades Fractal Model Indicator with POI and HTF context can clarify price delivery around specific reversals.
